June 2, 2005**

ScriptTech Announces the release of TMX/TP

Add Keyword Functionality to TestPartner™

Corte Madera, CA — June 2, 2005 — ScriptTech, Inc. announced the latest version of TMX, its successful test management and execution tool. TMX/TP is specifically configured to generate executable scripts for Compuware's TestPartner™. Providing a sophisticated keyword interface to the powerful industry leading TestPartner automation tool, TMX/TP allows non-technical business and QA analysts the ability to create fully executable automated scripts that can be run by Compuware's TestPartner.

With TMX/TP you can fully utilize your existing TestPartner™ technical experience to gain keyword flexibility and functionality. Take advantage of your existing expertise while opening up automated testing to your QA and business analysts with TMX/TP's intuitive point and click interface. As a result you reduce the learning curve of automation – allowing the QA and business analysts to get up to speed and be more productive sooner.

In addition, TMX/TP provides a "single point" test library for both manual and automated test cases. This allows easy identification of where changes have taken place within the application under test and which test cases are affected. Then automatically update all of the affected test cases - thereby reducing time and cost associated with the maintenance of tests. No more manually searching through the entire test library to identify impact on test cases whenever the application under test changes.

TMX/TP provides access to all of the power and functionality of TestPartner™ – but with the ease of a point and click interface – allowing more involvement in the creation of automated tests by non-technical resources.

TMX/TP can also be configured to generate almost any procedural code such as Java, C++, VB, C#, TCL or custom scripting. The user has complete control of the generated script code. TMX can generate scripts for web, SAP, client-server and host based applications – even embedded environments like cell phones and PDAs.

The TMX/TP keyword interface allows your business and non-technical QA analysts to become directly involved in the creation, maintenance and management of fully executable TestPartner scripts without technical training or experience.
